SUMMARY

Data Scientist with **4+ years** of experience in data analytics and data modelling, developing **machine learning models** and applying statistical techniques to complex financial and operational problems. Experienced across the **end-to-end** modelling cycle, from data preparation and feature selection through to evaluation and production, using **Python, SQL, PySpark** and **Databricks**. **MSc Data Science** graduate with a background in economics and financial analytics, with a strong interest in using data and AI technologies to understand patterns and solve problems.

SKILLS

Programming and tools: Python (Pandas, NumPy, Scikit-learn, Seaborn, Matplotlib, MLflow, Keras) | SQL | PySpark | Git | Databricks | Claude Code | Streamlit | Qlik Sense | NPrinting

Data Science and analytical skills: machine learning (classification, regression, clustering, neural networks) | GenAI & LLMs | Statistical modelling | Financial modelling | Dashboard creation

EDUCATION

MSc in Data Science The University of Manchester

Sep 2021 – Sep 2022 | Manchester, United Kingdom

Business and Management pathway | Distinction (**GPA: 78.25/100**)

BSc in Economics Universidad San Francisco de Quito

Aug 2012 – Jun 2017 | Quito, Ecuador

Adam Smith Scholarship for Academic Excellence | Magna Cum Laude (**GPA: 3.88/4.00**)

WORK EXPERIENCE

Data Scientist Azzurro Associates

Mar 2025 – Present | Hybrid - Manchester, United Kingdom

- **Develop machine learning models** focused on **increasing collections and reducing costs**, taking **ownership** from data preparation through to production and translating model outputs into actionable strategies tailored to the business problem. Examples include the **company's first model-based performance indicator for non-PG accounts** using CAIS commercial data to enable account ranking, and **a set of trace models** using Experian data from multiple sources (PD, Electoral Roll, CAIS, etc.) to identify and score the most suitable addresses for customers and detect potential changes of address.
- **Design end-to-end modelling pipelines**, covering data cleaning, aggregation and preprocessing. Perform feature selection, model training and use cross-validation to evaluate models using metrics tailored to the specific problem. Optimise performance through hyperparameter tuning and carry out final testing to make models **ready for production**, while documenting the full modelling process. Use **MLflow in Databricks** to track experiments across prototypes and production models, supporting reproducibility and continuous improvement.
- **Develop internal Python packages** used across the analytics team. The main package includes **methodologies** to calculate and recommend **settlement discounts** using statistical techniques and present value (PV) calculations.
- **Evaluate new external data sources** to identify opportunities to improve **collections and operational strategies**, working with **complex and diverse datasets** and assessing their quality, relevance, and potential applications.
- **Review** and **validate Python** and **SQL code** produced by the operations analytics team to ensure quality, reproducibility, and compliance with best practices.

Technologies used: Python, MLflow, SQL, Databricks, PySpark | **Business sector:** Finance

Investment Analyst Azzurro Associates

Aug 2022 – Mar 2025 | Manchester, United Kingdom

- **Analyse** and **apply machine learning techniques** to **price debt portfolios** from the UK, Ireland, western and northern Europe, having significantly contributed to the **investment of £77.3 million** in portfolios.
- **Preprocess data** of approximately **80% of the portfolio files** analysed. This involves cleaning, transforming, and integrating data from various sources and in different formats.
- Perform an **in-depth insight analysis** of the portfolios to understand their characteristics and see how they compare to other portfolios. Most of the analysis is done **using Python** and **SQL** in **Databricks**.
- **Create classification** and **clustering models** for analysis, and later use them to forecast collections. Conduct simulations using in-house tools, involving hyperparameter tuning tailored to individual cases, requiring a thorough understanding of the data and algorithms.
- **Present** and **discuss** the **analysis** performed **with senior stakeholders**, including the CEO and Analytics Director. Then prepare investment memos for the Investment Committee to approve, detailing important findings, portfolio characteristics, and technical pricing methodologies used.
- **Collaborate** with other teams **to develop** and **evaluate new pricing methodologies** designed to streamline processes and enhance account analysis efficiency.

Technologies used: Python, SQL, Databricks, PySpark, Microsoft Office (Excel, Word) | **Business sector:** Finance

Budget and Reporting Analyst Universidad San Francisco de Quito

Jan 2019 – Jun 2021 | Quito, Ecuador

- **Created Qlik Sense apps** joining financial information from different sources and pre-processing the data, reducing 120 minutes of labour per day for each team member.
- **Collaborated with the International Programs Department** creating **dashboards** that helped spot unnecessary costs and calculate the direct cost of their programs automatically. This development reduced the cost of all their programs by close to USD 80 000 from 2018 to 2019.
- **Produced** and **configured** the **automated delivery** of **financial status reports** to approximately 110 university researchers weekly through Qlik NPrinting. This initiative saved 2 days of work per month for each team member.
- Developed **personalized dashboards** for the **Research Director** with academic and financial data, creating data visualizations and KPIs that helped make informed strategic decisions that involved close to 2 million US dollars per year.

Technologies used: Qlik, NPrinting, Microsoft Office (Excel, Word, PowerPoint) | **Business sector:** Education

Credit Operations Officer Jr Diners Club Ecuador

Feb 2018 – Dec 2018 | Quito, Ecuador

- Identified improvement areas in the assessment process of the credit card applications that reduced the time spent per application by 16.6%. Analysed labour, financial, and credit profiles of more than 200 new applicants weekly in the credit card approval process.

Technologies used: Microsoft Office (Excel, Word) | **Business sector:** Finance

PROJECTS

Gaby's AI Agent: [\[GitHub\]](#) [\[Live App\]](#) Conversational AI agent serving as my 24/7 personal rep. Apart from having knowledge of my professional experience and background, it features real-time calendar integration, automated meeting scheduling, and Strava running data via Google Calendar and Strava APIs. **Techniques Applied:** OpenAI GPT-4o, Function Calling, API Integration, Streamlit.

Satellite Feature Detection: [\[GitHub\]](#) Image processing and object classification of ships present in satellite images (computer vision). UoM MSc project partnering with BAE Systems. **Techniques Applied:** Convolutional Neural Networks (Python).

Additional Projects:

- **Fraud Detection in Credit Cards:** [\[GitHub\]](#) Developed and evaluated models to detect fraud in credit card transactions using XGBoost, Random Forest and LightGBM.
- **Formula 1 Predictor:** [\[GitHub\]](#) Conducted EDA and developed models to predict race podiums and pit stops using data from the Ergast API, applying Random Forest, XGBoost and Multilayer Perceptron.

LANGUAGES

Spanish (Native), **English** (Fluent), **French** (Basic)

INTERESTS

Running: Ran first marathon (Rome 2026), training for Madrid 2027. **F1:** Lifelong Ferrari fan. Attended 2025 Belgian GP.
